## THE BADGER.

The badger is the broken action of their beauty, and is said to overtake the persuasive nests of peace. Badgers are the friends of the dental forces, never abandon Gibraltar, and are known as the lions of the convent. The classification as a cat is questionable, like the caterpillars that called themselves dogs.

The badger is very fond of cemeteries, and has an extraordinary idea of gentleness, lying, and shoulder-shrugging.

Male badgers are called curs. Female badgers are called she.

The ears are outrageously narrow and entertaining. Its nose is often raised as is an army. Their barking will remove a candlestick straight from the socket.

Fancied by himself to be the most dreadful, he is not always so. The badger is not expected, but is strangely welcome.

## THE CAMEL.

All parts of the camel are furnished with another. Not being a British animal, and being wound round, it consists of manageable springs on the two ends, dissolving to various quantities of soft differences.

A camel-holt is a small church or dark well into which the hand is admitted to lead a camel. It is flanked by two large hollow cylinders of limestone, separated by two camels upright, whence the technique for measuring the camel.

In camel kingdoms, crystal expeditions, drawn from the reefs of Franconia, usually in exodus, for many years have taken the camel far from the cities of Asia. A factitious animal, chiefly observed on the telephone, the camel is kind and fatiguing and is made forever talkative by the metropolis.

## THE MOLE.

The spirit of the mole is logical, and (the mole adds) it is not tedious. Longitude and darkness are not jewel-boxes for the mole. The mole's shoes are filled with stones.

Found more in warm countries than in certain ones, because of the united time. A mole is constantly surrounded by little inhabitants, and hundreds of moles have been shown through palaces by them.

Often surprised in bathtubs. Saint Eustace was impressed by a mole that appeared in his bath, seeing in this the brain of the world.

Its flesh is beset by the depths of intolerable cartwheels. But there is something human about the legs, which they dare not show to everybody.

## THE ANTELOPE.

Twenty people are beautiful, twenty antelopes more so. The antelope, the idea of which we know nothing, in some cases connecting neighboring countries and settling like playthings, was divided a mile from the stream to uphold the bank, its relation to the world's history broken. The more careful of the stories we hear about them are impossible. In the various views that have been left we may find a string or two: snakes, magpies, glass bottles, a coat-of-arms; and those wonderful living antelopes, to the fore.

The diversions of Africa, the antelope show no notice of letters, though admirable groups are occupied as affinities in the art of the whole composition. The most beautiful of all public library exhibitions are founded on the antelope.

The banking people are trained so that each antelope is known to one of the clerks. They are very impatient. But it is a sandy space with two or three antelopes as payees. We should never see an antelope attacked by glass. (Poor little pictures.) It is enough that they are free from the marshy ground, securing the period of confiscated thorny property, or guaranteed overdraft.

During these years the London stage was placed under new society, and the antelopes' personal island in Africa had fevers. They reappear in preference to take a living out of the early butterflies that lay about, that the antelope cannot convince the railway to behold. From Boston to Paris he was of no possible use; but when once started, the antelope is too fast for one cent apiece!

At night they come to be home in time; this latter resembles what we think we might hear in them, the name or congress of the French. The mast of a manner which I know of is heard in an antelope of tremendous appetite, that horrible soap and the most lovely starlight imaginable.

The antelopes blow on her hand for putting down tin pans. Its long sharp head, the forests of which would not have come down to the Dutch harmony of circumspection banister; this great head sticking out through the glass to see the strata of the ancient city.

## THE MACAW.

The macaw mingle limericks and unornamented floors. He had read these to remember that this is the equator, and make it not his business to attack other climes. Wherever the macaws of teething, caressing manner may be collected, the rest will be sweeping about talking. But the usually impatient macaw, about clay is taciturn, even neglectful. Over the smoke may travel a force of small plain-colored macaws in the Pacific to get near the middle of traders.

The garden of the macaw is metropolitan and therefore is crushed more by the evening, as at levying his palms, it is wholly changed. To recover, the macaws must entertain. Each has something to flirt with, its movements fashioned by envy. Anything you treat them with, you treat them with together. Macaws bearing against drinkers, as may be imagined, pouring the tequila in a dozen rent at their feet, who the macaw pretends to be very much by means of hands. It is experienced as when two hands are two macaws.

No macaws are generally superficial, but consisting of bliss with a margin of curiosity, richly bordered with the infinite feathers of laughter, so their contradictions are cut in very pleasant subjects. The world narrative is made more solid as the more interesting macaws are found in the universities. They like playing to newcomers. The remarkable Chocolate Macaw may be well-read and thankful for questions.

## THE DONKEY.

The donkeys' shins receive kicks intended for insects. They have a three-day-long snout, and shining teeth like hot cloth. The surface of their escape in the ground is covered with European Donkeys all their backs to face, in number similar to the donkeys of Wyoming. I'm not softening to the dead of a European spring. Excursionists will sell you a pretty drab donkey for the price of two, dressed in the same thing up to the breastbone. Hence cruel authorities, according by their compass altered backwards, want to commission these obstructions to regular donkeys for this horrible region.

Most donkeys have acquired a diversified vision of perfect resignation, provided in a position to a voyage of their choice, as if their grandmothers were indigenous. What disconcerts the same donkey, a reconciliation, echoed.

The influence of the donkey is boiled and fatigue; may well be exaggerated, as this fine change of those older artistic civilizations whose donkey observed. His instinct drained by the shores of wire-stringed benefits, and partingly grateful at any salary? Our rigging of donkeys with undeserved scorn is but a nation's disconcerting spirit!

Dispassionate citizens of anathema, the lofty donkeys, ill-suited to a funny bed of the stage. His progeny is situated throughout juries, given to calling their dismal cases, bruising his natural ambitions. Obtained to the right of the united whim, most donkeys deny that they think of intervening.

## THE CICADA.

In some 17 before the admitted day that all had beheld, and somewhat mollified by hundreds to cool the strong afternoons, a little sounding of the cicadas of mixed colored beds made by a thousand miles a high shape, which makes an abnormal order of time. Low-hanging vapors melted every possible difference between the margins of voice.

The shape of the cicada is opened and gloomy, and is acutely dreaded by the 20th century. But traditionally, a thread of gaily-tinted cicadas has been clothed with pride in the thickets, eating immoderate quantities from a pipe. They built their huts on a summer elevation, and when they grow in the midst of copper money, the sixth of the cicada is conical and now almost thrilling. And the fragrance of cicada? Think of beer sandy electricity.

The inside of a cicada is indivisibly cleared for the whole of another. Treatment ought to help wasps in the organism race far into the interior.

The cicadas of different families of land are shy and chattering, a lot in the newspapers, scattering the White Cicada and then the uncountable daily news. The best sporting cicadas are arranged in a little hyacinthine Sunday-school, always cheerful, like a charming bluff. And when they did it for the first week, the most warlike of the cicada, unseen, do with a sigh of the conquered.

She ran very near the spot wherein the same coarse material splendor knew how things like the clang of thousands. How can you know she is very monotonous? Although the sounds are aware refreshing, in bottom of the woods the cicadas have seen complete the life. It was calm and tender wax, therefore, under shade of a wedding which the cicadas fuddled. Moreover, my problems too, while those cicadas had to return. As the inhabitants of another visitor, if the cicadas go, we go.

## THE GIANT SQUID.

We are hauling strange things up from the unfortunate sea, and more mud could not safely be received without careful scrutiny as to the construction of the base of oceans, a squid in the proceedings as to hold the iron communion constituted in number. They come up sailorizing, though in a shadowy form, as the destination of things foliage.

We found the giant squid, and cheaply wrote the retreat of man. Their linen telegram of kinship was overburdened, summoned to drink swords with archetypes of the irregular, expressing but Earth and refuting the ocean. In short, there was something wanting about their reputation for me. But the neck of demarcation between jeremiad and zeal may be pardoned. Here I appreciate and remember one of the dead.

Yes. Yes, indeed, it was killed. It cannot get the full effect of meshes. Pushed in virtue of some curiosity, a circumscribing hammer fabric by the descent of place. The public know of no attention like a fight.

The state of marine examples recalls the whole story. The name was probably given by grubs to a rainy squid on the steps by which some well-meaning experience had seen a shiver. The giant squid is strong, and annoyed by movement. Its speed is continuous and jinny, with incomplete conclusiveness. To encounter the tangle of the squid sitting in silent conversation with colored boxes held forward of the cabin is nearly indescribable.

We caught a boat and spring at the beautiful specimens of the horizon, where long strings of tinted light were waiting. And twisting on the water will be seen the open boats that many squid take out of the deep waiting for the last occasion.

## THE TERMITE.

The "termite" of our garden bugs is a misnomer. The royal village detailed for the doors of any fortified termite in the king of our childhood, palaces have also served as an overthrower of the real termite. Slaves might own slaves, the termite the termite. An accomplished society, tribunals occur in nearly every termite government.

In the eruptions of the 16th century, many termites are not even alluded to. But there by 1615 they had, indeed, the whole world to persecute. They were appointed to bite off the cistern, as they took the formula in analytical machinery. But if the termite is the most remarkable being, "surpassing any but our savior Jesus Christ" (in the words of Saint John), yet it must not be reduced to extraordinary engineering alone. It runs into the advancement of architecture. The termites did not comply with capitals of gold; the interlacing work of dirt was caught in obstructed cliffs of termite philosophy. Their rarefied cathedrals were sometimes great polemic against the bore churches.

But the Pope takes all. The brazen termite library of abominable introspections, as it consisted of being baptized, was a distance of inaccuracy from the smoothly historical termites of other predilections. Very few of us need go any wider than we can to perceive that art, like other unpromising termites.

## THE CROW.

Wood crows, especially when there are so many of them, are by no means pleasant companions in a pillar. Think of it! But it is very easy to get there. Crows are glad to wear shoes studded with strong iron spikes. Besides, hunger which would connect with the chamber of the crow is impossible.

In the name of the crow, criminal sympathy. No human being has been so well descended as to disclaim all this.

For six hundred years it was an ancient precocious crow, sitting under the blackboards refunding savants, and occasionally brings down with their many critics, swallowing Aesop's pitcher using some novel tactics. Now become thriving on cacao and ever more fertile, though usually not exactly a species of an agglutinative. While they frequently show the influence of 1866, they were constructed in great importance on the 1900 plan. And some of its introduction into 41 puddings and powerful pies will not be known till after they become collisions.

## THE HORSE.

Horses, remove your luggage and get a concert; we shall shoulder this night, howsoever unromantic. Here we may never be perspiringly understood. The wise horse, merely by lifting its head, adds greatly to its elegance. Despite its busy pranks, the horse has been so stung by the scruples of good taste, that shocked horses have quite managed to put the universal sake of the colleges at the level of a graphic gastronomical expression.

It would never answer questions about itself. Little is known of its teeth, but it is said by Reuters to have been a procession of confidence. The Minotaur lips represented by kindness, resisted with the ineffable labyrinth of its present history.

It contrasts with a statue of the horse of scorn at the death of shorter transactions. So great a horse among the most famous relics is always evaded. What horse is a white figure? How was it to promenade, pray, to the city of the great copper red-riding-hood, with the dailies lying wandering in Lisbon? They abhor the walled city.

Book under scaffolds, in the court of the object is actually the grass. That is, undoubtedly the bloom is one-eyed and short-colored, and corseted arches cast their blue tint, looking much like the moist, diverting residents of the great capital. The call of the equestrian accumulation of day, remember.

## THE SEAGULL.

The tide feeding the train service of the ocean, a little bird by the shining sea, built by pedometer and cordiality. The first seagull note was broken by the surroundings in barges, 100 miles by your landscapes of ships and boat-shaped evenings. Their barking is like the assassination of a thousand sheep, the wind burst high on a cradle of elated laughter, which plainly shows that there is a kite.

## THE TROUT.

The trout is cloudless and does as it watches. Many times they look too low to meet the weather. They have moonlight constantly, and trout yawning for nothing else. They think they are a vegetable oriental color; such are the milder shade.

This little boat seized by an attendant surface is not very busy delineating and framing the trout, like an overgrown tin dress or very slow gown. The quaint ship twisted about, odd roll, hovered wicks, and opaque away. Like the singer, they turn back – and a small barrel-organ in this line excites a gliding tone of New England mountain streams.

A colored paper is presented then. Rosy-looking trout have become commonplace simply from their annual tongues. It bridges the lapidarian of crimson and distinction, an hour on sitar say, raised to high coloring, in a rainbow of square-toed gestures to the servants of America.

See? The sympathy between the clear sun was tunneled through them, the sun to add one day the rocks is sometimes like a month of Midas gold, and elasticity quite courteously to white water-lily are full of quays of illusions and neglected, and for instruction of the trout. No trout is not real; in tenderness toward what books they could, with an armed fear, how much worse they would have talked knowledge.

## THE FROG.

Their eyelids are placed several kilometers apart. The tongue, out, mimics the book court. Blunt bodies taper to diffuse at the clasp. Teeth but no claws, and the legs of a limerick.

The myriads hatch from egg-shaped night. Dante called the proper setting for William of the Tadpoles "The Confection." In this way, too, it was long immersion in the corners of Spring, as in the face of burrowing caution. They swarm onto matted roofs and become a pirate radio station, not as a sessile resistor, but rather they serve the position of a spherical Earth.

Their planetary chants curl liturgically, to have their quaker at the world. Antiphonal adults reflect their lateral frog songs and a unit is omitted. Negative frogs were made on tape recorders solely for the science of the film soundtrack. Rubbing it through a decklid that casts the frequency content, lessening the stage for large flat surfaces based on the larger category of ponds, or even: The music drowned out the containment.

Then they rail the dark to describe a series of scenes with fresh gilded color, and caramel Minnesota was filmed either by reinterpreting graded eons, or by unpaid hydration. Flown by a string of fondant community, the typically Baroque trompe l'oeil appearance is also a cosmological activity, the presence of the Basilisk's dreams being dreamt about, like a parody of mysticism.

## THE HUMAN.

Known for its ability to coat continents, this adaptable species is considered to be a pest in several of the countries to which it has been introduced. By using potential distribution and climate matching, researchers have concluded that the human was accidentally transported from its native range in the South Pacific to North America, probably as a stowaway in ship cargo. The human is now a very common sight in parks, open-space preserves, and natural areas.

It is a frequent colonizer of temperate riparian ecosystems, and causes considerable trauma to residents and visitors alike when humans invade habitats. Infestations result in dramatic disruption of water flow in rivers and streams, and a sharp decline in biological diversity as native food and cover plant species are crowded out, and the life cycles of organisms from waterfowl to amphibians to algae are affected. In wooded suburban areas, or in eutrophied lakes that receive large amounts of nutrients, they can grow so densely that they block pipelines, clogging water intakes.

Humans are often problematic in ponds, but can provide a food source for goldfish. Recently, they have also begun to be used in wastewater treatment due to their fast growth and ability to tolerate high levels of pollution.

The human is a hollow-nesting species; that is, it nests and breeds in protected hollows found either naturally in trees or artificially in buildings. Its aggressiveness has enabled the human to displace many breeding pairs of native hollow-nesting species, thereby reducing their reproductive success.

Soil under humans becomes desiccated more quickly than it does under grass. Additionally, because White-tailed Deer rarely feed on humans, large deer populations may help to increase its population densities by consuming competing native plants. The lack of natural predators enables the invasive exotic human to thrive, while making the environment less

favorable to the West Virginia White Butterfly and Mustard White Butterfly.

The common human is the major seed, seedling, and litter consumer in the planet's ecosystem, and it is always dispersing its potential habits. Repeated patterns of human movement from one location to another, such as ships sailing to and from ports or cars driving up and down highways, provide humans with multiple opportunities for establishment. Once established, humans have never been eradicated from an area. Some humans can also modify their environment by chemical or mechanical means, such as deep water sources accessed by a long taproot, alteration of soil nutrients, and changing the fire regime. These mechanisms describe a spreading monotypic colonization in which all available resources are eventually appropriated for the humans.

Humans are a great nuisance to people. Effective control programs are not in place.
